

## **CARROT HYBRID KXPC-043**

### *A Kuroda type Carrot*

KXPC-043 is a dark orange, very smooth Kuroda type carrot variety. The foliage is dark green in color, very strong and reaches 19 to 22 inches in height. Roots are very uniform in color, shape, and size. At full maturity the roots are 7 to 7  $\frac{3}{4}$  inches in length and about 1  $\frac{3}{4}$  to 2 inches in diameter.

This Kuroda variety matures early and produces carotene very early in root development. It can be compared to Koyo 2 variety but is more resistant to premature bolting.

KXPC-043 has shown a good level of resistance to *Alternaria dauci* and *Cercospora carotae* in field trials.

Markets: Asia, Australia, South Africa, and India
